ORG: Department of Coke Industry, VSB, Ostrava (Katedra koksarenstvi VSB)

TITLE: Development of new coke production methods

SOURCE: Hutnicke listy, no. 9, 1965, 614-621

TOPIC TAGS: coke, coal, industrial development

ABSTRACT: Addition of binders, treatment before briquetting, thermal treatment of coal, its mixing with binders, and the briquetting of the mixture are reviewed. Carbonization in a horizontal level, electrical coking processes, fast heating to temperature of plastic consistency, and form preparation are described. Preheating of the charge, preparation of mixtures containing badly coking coal, and new methods of coke production are discussed. French process according to French patent 1222793 is described. In Czechoslovakia the development of intensive coking methods is slow because of the incomplete state of an over-all classification of Czech coals. Development of new coking methods cannot, however, be postponed any longer. Orig. art. has: 7 figures and 2 tables. [JPRS]

Fever."

Sofia, Suvremenna Meditsina, Vol 14, No 5, 1963; pp 16-18.

Abstract : Data on 296 patients with meningococcal meningitis 1954 -
1962: 226 received penicillin, vitamins, 'kortigen' (cortisone?),
sulfonamides, plasma; and 70 penicillin with streptomycin or other
antibiotics. Only side effects were a few cases of dermatitis; minor
neurologic sequelae of the primary disease in 3. Seven of the 70 died.
Of 929 cases of scarlet fever treated with penicillin (200 to 400,000
units daily for 5 days) 1957-1960, 25 had complications.

Title : Passage Through Critical Energy in an Accelerator with
Strong Focusing.

Orig Pub : Zh. tekhn. fiziki, 1956, 26, No 3, 576-584.

Abstract : As is known, the stability of radial-phase (synchrotron) oscillations in accelerators with hard focusing is destroyed at a certain energy, called critical, and depending on the structural parameters of the accelerator. Analysis of the possibility of going through the critical point is essential for the theory of accelerators with strong focusing. The authors have considered the equation of phase oscillations in the vicinity of the critical point and the requirements that must be met when going through this critical point.

TITLE: The effect of long-chain quaternary ammonium salts on the porosity of bentonite clays

PERIODICAL: Akademiya nauk Ukrayins'koyi RSR. Dopovidi, no. 11, 1962, 1479-1481

TEXT: The authors studied the possibility of improving the swelling characteristics of bentonite clays on firing, to obtain the desired porous light-weight product used as a filler in concrete and ferroconcrete. Only few natural bentonites develop the required porosity in the absence of any additives. Using Kurtsevo, Cherkassy and Gorbsk bentonites, it was found that swelling may be induced during firing, by replacing the natural inorganic exchange complexes of montmorillonite with tetraalkylammonium cations (the alkyl groups being large). The beneficial action of this treatment is ascribed to the fact that the quaternary ammonium cations adsorbed on montmorillonite are only partially removed on heating to

Card 1/2

The effect of ...

S/021/62/000/011/011/013
D202/D307

400 - 500°C, leaving a layer of C which is then oxidized to CO₂ as the temperature rises above 800°C. Owing to the low softening temperature of montmorillonite the CO₂ may then exert a bloating action, giving rise to products of density as low as 0.22 g/cm³. The required effect may be controlled by selecting the length and structure of the alkyl groups in the organic cation. ✓

TITLE: Method for obtaining insoluble polyvinylalcoholic fibers and their products.
Class 8, No. 17503315

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 19, 1965, 12

TOPIC TAGS: polyvinyl fiber, polyvinyl, polymer, plastic, colored polymer

ABSTRACT: This Author Certificate presents a method for obtaining insoluble polyvinyl alcoholic fibers and their products manufactured by acetylation with an acetylating agent. To increase the variety of acetylating agents and, simultaneously, to color the products, dispersed anthraquinone dyes containing an aldehyde group, for instance, N-(anthraquinonyl)-S-aminocaproic aldehyde, are used as acetylating agents.

TITLE: Leveling properties of active dichlorotriazine dyes in dyeing capron tricot
linen

SOURCE: IVUZ. Tekhnologiya tekstil'noy promyshlennosti, no. 5, 1965, 94-99

TOPIC TAGS: textile, adsorption, dyestuff, surface active agent

ABSTRACT: The leveling properties of dichlorotriazine anion active dyes in dyeing
capron in acid media and the possibility of improving the leveling by using cation
active compounds were studied. Leveling agent A (a quaternary salt of a
dialkylaminomethyl derivative of a polyglycol ester of alkylphenol) and Alkamons OS-2
and N (mixtures of methylbenzosulfonates of the diethylaminomethyl derivatives of
diglycol esters of higher fatty alcohols) were evaluated as the cation active
compounds. The Alkamons enhanced absorption of the dye from the bath by the capron
fiber more than did agent A. Use of 0.5-1 gm/l of the Alkamons together with 1-2 gm/l
of ammonium acetate significantly improved the leveling of the two dichlorotriazine dyes

TITLE: High-pressure and High-temperature Fans (Ventilyatory vysokogo davleniya i vysokikh temperatur)

PERIODICAL: Sb. nauch. tr. Zhdanovsk. metallurg. in-ta, 1957, Nr 4, pp 97-100

ABSTRACT: Descriptions are provided of fans (F) built and tested at the Metallurgical-furnaces Laboratory of the Zhdanov Metallurgical Institute. The high-pressure F create a head of 1150 mm water, have rotors (R) of 800 mm diameter with 16 blades curving rearward, and deliver 10,000 m³/hr. The R operates at 2840 rpm, and the motor develops 30 kw. The R of high-temperature F are made of special Cr-Ni steel; the shaft and bearing housing are water-cooled. The R having a 400-mm diameter has 12 blades and operates at 3000 rpm; the F, with 110 mm head of water, delivers 800 m³/hr. The motor has 1.5 kw power. The F were tested for 10 hours of continuous operation with air heated to from 100 to 980°C in coil-type electrical heaters. In order to obtain a complete picture of service

High-pressure and High-temperature Fans

strength, cold R were subjected to a flow of hot air, and hot R to a flow of cold air. The F were tested for operation with air, CO₂, and steam. In 5 months of operations, the R showed no damage of any kind, the surface of the metal remaining smooth and bright.
